

A market first in Downer cow management

- Increases dry matter intake (DMI)
- Keeps herd in positive energy balance
- Cows produce significantly more milk.

A simple to use oral supplement that assists cows around calving to move smoothly into lactation by meeting specific nutrient requirements that commonly impair performance.

The freshly calved cow has a dietary requirement for a great many nutrients, and it is not uncommon that in the period post calving when feed intake is depressed that she can run short of demand.

That is when Keta-go steps in to fill the gap and get her back on the road to success.

DIRECTIONS FOR USE:

Provide 500mls per head once daily for 3-4 days.

The nutritional benefits may assist with the proactive management of;

- Over-conditioned cows
- Cows with excess body weight loss
- Ill-thrift
- Lack of appetite
- Assisted calving/twins
- Retained foetal membranes
- Downer cow.

The product can be used prior to calving if needed, but it is generally used post to help with the above issues.
